An Introduction to Beautybook template

FIRST EDITION

| Beautybook

PREFACE

In this note, we obtain a logarithmic vanishing theorem on certain weakly pseudoconvex Kähler manifolds. It is a generalization of Norimatsu's result on compact Kähler manifolds. As a direct corollary, we obtain relative vanishing theorems of certain direct image sheaves.

PART I

THE TEMPLATE USAGE INTRODUCTION OF **BEAUTYBOOK**

Here is the introduction area of each part, where you can write a concise overview of the part, of course, if there is nothing to say, you can leave it blank.

A SHORT INTRODUCTION OF **BEAUTY-BOOK**

Part I

Sec 1.1 Introduction

The Beauty \LaTeX collection is a series of templates authored by a humble, unknown individual. In fact, there are only two series, one is the custom book template **fancybook**, which is dedicated to the fresh and elegant style, the other is my flagship product- **Beautybook** ! Why did I choose such an unusual name? My answer is, originally I wanted to name it elegantbook, but there is already the famous elegantbook template. Inspired by the old poem "There is a jade-like beauty waiting for you in the book", the template is named "Beautybook", which means a beautiful woman in your arms and the fragrance of a book overflowing! Therefore, this is the origin of the name **Beautybook** !

I am committed to creating a series of beautiful, elegant, simple template to facilitate the use of users and myself. Version changes frequently, please pay attention to version information. Before starting to use templates, it is recommended to choose the latest official version! The latest test version will usually be released in the QQ Group, you can download it and try it yourself!

This article covers some of the setup and basic usage of this template. If you have any other questions, suggestions or comments, feel free to submit them to me on GitHub [issues](#) or [163 mail](#) or QQ mail [QQ mail](#).

The Project Addresses are the following.

- GitHub repository: <https://github.com/BeautyLaTeX/latex-template>,
- Download Release: [Official release](#),
- User QQ Group: 809237593. (!If you are not in China, please e-mail me at [outlook-email](#).)

This work is released under the LaTeX Project Public License, v1.3c or later.

Sec 1.2 Installation and Maintenance of Template

There are two ways you can use this template. The first method is trivial that just download the zip of template from above channel, and then unzip and compile the main file in the archive (i.e. a file with a name like "Beautybook-xx. tex"). The second way is uploading the zip of template to `overleaf` to comply.

Note that if you choose the second way, you must write `math-font=plain` in the preamble of the main file!

It is worth noting that when you download the template from CTAN, then the English version of it does not use any third-party fonts, so that one can be compiled using `pdflatex`. This is an exception to the rule under which all other files must be compiled using the `XeLaTeX` engine.

1.2.1 Local Installation

To install locally, follow these steps: download the latest version from GitHub, CTAN or the QQ group. Then place the template files in your working directory and copy these folders synchronously: fonts, stys, figures, inner_pics, and frontmatter, in order to utilize them. (If you are a chinese user, you can choose to copy the chinesefonts folder.) The advantage of this is that you can install mtpro2 font to achieve a more elegant effect than if you were using it online. Of course, the choice is left to the users, and I won't comment here.

The following is an example of a minimal work:

```

1 \documentclass[12pt]{Beautybook-EN}
2 \coverstyle={
3     cover-choose=enfig, % cn (en ; enfig ; birkar)
4 }
5 \mathstyle={

1.2.2 Release installation and updates

The test environment for this template is

1. Win11 22H2 + T_EX Live 2023;

For the installation of T_EX Live/MacT_EX , please refer to articles online, which is omitted here.

After installing T_EX Live, it is recommended to upgrade all macro packages after installation, upgrade methods: use “cmd” or “terminal” to run `tlmgr update --all`, if `tlmgr` needs to be updated, use `cmd` to run `tlmgr update --self`, if there is a break in the update process, please use `tlmgr update --self --all --reinstall-forcibly-removed update`, that is

```

1 tlmgr update --self
2 tlmgr update --all
3 tlmgr update --self --all --reinstall-forcibly-removed

```

Please refer to [How do I update my T_EX distribution?](#) for more information.

The English version of this template is based on the basic “book” class, and the Chinese version is based on the “ctexbook” class, so the option of book or ctexbook is also valid for this template. The default encoding is UTF-8, and it is recommended to compile with TeX Live.

Sec 2.1 Language Mode

This template includes two basic locales: `Beautybook-CN.cls` in Chinese and `Beautybook-EN.cls` in English. Changing the locales alters the headings (including figures and tables) of the chart title, the article formatting (such as table of contents and references), and the language used for theorem contexts (such as Theorem, Lemma, etc.). You can switch between these language modes using the following instructions in the top of the preamble:

```
1 \documentclass{Beautybook-CN} % chinese
2 \documentclass{Beautybook-EN} % english
```

In addition to the two language settings that come with the template, if you need to use another language, you can do so by modifying the `.cls` file as follows

1. Change the name of the part environment `Part\ \thepart` to (translation of part in your language) `\ \thepart`
2. Theorem environment guide words in preamble, such as Theorem.
3. Please remember that only Asian languages can be modified based on `Beautybook-CN.cls`, other foreign languages need to be modified based on `Beautybook-EN.cls`.

Sec 2.2 Theme Color

The colors of this template can be configured according to personal preferences in the following way :

```
1 \definecolor{bg}{HTML}{e0e0e0} % Overall style background color % i.
   e. theme light color
2 \definecolor{fg}{HTML}{455a64} % Overall style foreground color %
   i.e. theme dark color
3 % The colors below are in the stys/bottompage.sty file
4 \definecolor{coverbgcolor}{HTML}{f9b868} % Cover and bottom
   page background color
5 \definecolor{coverfgcolor}{HTML}{503D4B} % foreground color on
   the front and back covers
6 \definecolor{coverbar}{HTML}{BF8E6F} % cover bar color
```

2.3. CHOICE OF COVER

```

7   \definecolor{bottomcolor}{HTML}{B3686A}           % The theme color of
bottom page
8   %%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
9   \colorlet{framegolden}{fg}                       % Antique
box's line color
10  \colorlet{framegray}{Dilu!5}                     % Antique
box's background color

```

In the preamble of the main file, certain theorem environments' colors can be set. This will be further explained in the upcoming section on mathematical environments.

Here it is recommended to use the color configuration of the `encolours` macro package developed by Lin Lianzhi, and you can select the appropriate color for comparison.

Sec 2.3 Choice of Cover

2.3.1 How to choose your favorite cover?

This template has multiple sets of covers that can be used at will, and the use of them is as follows:

1. Chinese classic cover (Chinese default) –corresponding macro package `cover-choose=cn`,
2. Springer Classic Cover 1 (English default) –corresponding to the macro package `cover-choose=en`,
3. Springer Classic Cover 2 (image background) –corresponding to macro package `cover-choose=enfig`,
4. Springer Classic cover 3 (Geometric style) –corresponding to the macro package `cover-choose=birkar`.

Note that the information corresponding to the cover is not the same, look at the above example, just follow the requirements.

Table 2.1: cover element information

Information	Commands	Information	Commands	Information	Commands
Title	<code>\title</code>	subtitle	<code>\subtitle</code>	author	<code>\author</code>
Publisher	<code>\pressname</code>	Version	<code>\edition</code>	cover image	<code>\coverimage</code>
Logo	<code>\presslogo</code>	English title (cn)	<code>\entitle</code>		

2.3.2 Logo

You can search and obtain the publisher's logo yourself. To avoid copyright infringement, please ensure to choose a proper and lawful image when replacing the current one.

2.3.3 Custom Cover

Moreover, in case you opt for a personalized cover, say an A4 PDF file created through Adobe Illustrator or any other software, comment out the `\makecover` command, and subsequently include the custom cover using the `pdfpages` macro package. Likewise, if you utilize the `titlepage` environment.

Sec 2.4 Title Style

This template is fully customized for section headings, if this is not to your liking, you can comment them out to restore the default style.

Sec 2.5 Introduction to the Mathematical Environments

Our template includes four distinct theorem environments. These consist of the default theorem style provided by “amsthm” in simple mode, as well as a custom style provided by “thmtools.” Additionally, we offer a color emphasis box style, an exquisite box style that I developed, and an ancient style box provided by Mr. Wuyue, which can also be used as a theorem box.

2.5.1 Usage of theorem environments

Here is the effect of the theorem environment provided by amsthm.

2.5.1.1 amsthm

Remark. *This is an amsthm-based annotation environment*

2.5.1.2 thmtools

Proof (description of proof). Proof environment ■

Solution (description of solution). Solution environment ■

2.5.1.3 Color emphasis box style

Definition 2.5.1 (name of the definition). *The first defines the environment*

Theorem 2.5.1 (name of the thm). *The first theorem environment*

Corollary 2.1 (name of the corollary). *The first inference environment*

Proposition 2.5.1 (name of the prop). *The first propositional environment*

Example 2.1 (name of the example). *The first example problem environment*

Lemma 2.5.1 (name of the lem). *The first lemma environment*

Sec 2.6 Two exquisite theorem boxes crafted by the author!

Definition 2.6.1. (Name)

Here are the guidelines for using these two boxes.

- If the theorem name and label are both empty, you can write it like this :

```
1 | \begin{definition}
```

```

2 |           Define the environment content
3 |     \end{definition}
4 |

```

- If you don't have a label but have a name, use it as

```

1 |     \begin{definition}[][Name]
2 |           Define the environment content
3 |     \end{definition}
4 |

```

- If you have a tag, then whether or not it has a name, use it as

```

1 |     \begin{definition}[][Yes, fill in, no blank][Tag]
2 |           Define the environment content
3 |     \end{definition}
4 |

```

- If you want to change some setting options of the box, such as bordering, etc., use it as

```

1 |     \begin{definition}[tcolorbox options][If so, write
   | the name, if not, delete it along with the outside brackets.][
   | tag (Here is where the label is written, if there is no label
   | should be deleted together with the outside brackets.)]
2 |           Define the environment content
3 |     \end{definition}
4 |

```

Theorem 2.6.1.

The usage is the same as above, refer to the tag [2.6.1](#) below or you can [Definition 2.6.1](#).

Lemma 2.6.1.

The usage is the same as above, refer to the tag [2.6.1](#) below or you can [Definition 2.6.1](#).

Corollary 2.6.1.

The usage is the same as above, refer to the tag [2.6.1](#) below or you can [Definition 2.6.1](#).

Example 2.6.1.

The usage is the same as above, refer to the tag [2.6.1](#) below or you can [Definition 2.6.1](#).

Ancient style box

Test ancient style box , you can use it to nest outside of other environments arbitrarily!

2.6.1 Theorem counter adjustment

If you want to modify the theorem environment to count by section, you can modify the `chapter` in the counter option `counter/.code`, the available options are `chapter` (default) and `section`, `subsection`, etc.

2.6.2 How to define a new theorem environment?

There are four ways in which users can define their own theorem environments. Among them `amsthm` and `thmtools` can be learned through their macro package documentations. The latter two theorems are defined in the following way.

For example, in preamble of the main file, you can write it as

```

1 % This is the first one.
2 \mynewtheorem{
3   defi={\textbf{Definition}}[section]{interior style={left color=
ReD!8,right color=ReD!5!CyaN!50}, borderline west={1.5mm}{0mm}{ReD}},
% It is a example of the first one, then you can mimic it to build the
theorem setting you need.
4   }
5
6 % This is the second one.
7 <environment name>={
8   counter=tcb<theorem counter>,
9   the counter=\thesecion.\arabic{tcb<theorem counter>},
10  autoref name=\bfseries <environment name>,
11  style={
12  arc=3pt,breakable,enhanced,interior style={top color=<your color
>!12 ,middle color=<your color>!9, bottom color=<your color>!6},boxrule
=0pt,top=8mm,
13  fuzzy shadow={-0.6mm}{0.6mm}{0mm}{0.3mm}{white!50!gray},
14  fuzzy shadow={0.6mm}{-0.6mm}{0mm}{0.3mm}{fill=white!40!gray},
15  opacityframe=0, opacityback=0.98,
16  fontupper=\itshape, step={tcb<theorem counter>},
17  before pre=\smallskip, after app=\smallskip,
18  overlay unbroken=\my@theorem@overlay@unbroken{<environment name>\
\thetcb<theorem counter>}{<your color>},
19  overlay first=\my@theorem@overlay@first{<environment name>\ \
thetcb<theorem counter>}{<your color>},
20  overlay last=\my@theorem@overlay@last{<your color>},

```

```

21     }
22   },
23   <environment name>={
24     counter=tcb<theorem counter>,
25     the counter=\thesection.\arabic{tcb<theorem counter>},
26     autoref name=\bfseries <environment name>,
27     style={
28       arc=0mm,breakable,enhanced,interior style={top color=<your color
>!12 ,middle color=<your color>!9, bottom color=<your color>!6},arc=3pt
,boxrule=0pt,top=7mm,bottom=5mm,
29       fuzzy shadow={-0.6mm}{0.6mm}{0mm}{0.3mm}{white!50!gray},
30       fuzzy shadow={0.6mm}{-0.6mm}{0mm}{0.3mm}{fill=white!40!gray},
31       opacityframe=0, opacityback=0.98,
32       fontupper=\normalsize,step={tcb<theorem counter>},
33       before pre=\smallskip, after app=\smallskip,
34       overlay unbroken=\my@lemma@overlay@unbroken{<environment name>\ \
thetcb<theorem counter>}{<your color>},
35       overlay first=\my@lemma@overlay@first{<environment name>\ \
thetcb<theorem counter>}{<your color>},
36       overlay last=\my@lemma@overlay@last{<your color>},
37     }
38   },
39 }

```

Remark. Change the following parts :

<i><environment name></i>	→	<i>your new defined theorem name</i>
<i><theorem counter ></i>	→	<i>your new defined theorem counter</i>
<i><your color></i>	→	<i>your new defined theorem color</i>

Sec 2.7 list environment

This template is customizable with the help of `enumitem`, see the `enumitem` macro package documentation. Here are two examples.

- | | |
|---------------------------|-----------------------------|
| ⊙ first item of nesti; | 1) first item of nesti; |
| ⊙ second item of nesti; | 2) second item of nesti; |
| – first item of nestii; | (a) first item of nestii; |
| – second item of nestii; | (b) second item of nestii; |
| * first item of nestiii; | i. first item of nestiii; |
| * second item of nestiii. | ii. second item of nestiii. |

Sec 2.8 References

2.8.1 print reference

`ref.bib` is a file stored in the reference and needs to be placed in the working folder.

2.8.2 modify reference format

In addition, this template calls the Biblatex macro package and provides Biber engine to compile references. Of course, you can also directly delete the Biblatex macro package in cls file (the last few lines of cls) to use Bibtex.

For bib items, you can pick them up in Google Scholar, Mendeley, Endnote and add them to `ref.bib`. When quoting in the text, just quote their bib key.

The default reference style used by the template is “GB7714-2015”. There is a simple reference example. [1]

If you need to set to a numeric style, you need to change the “GB7714-2015” in the biblatex macro package option to “numerical”.

```
1 \usepackage[
2 backend=biber, % can be changed to bibtex (or simply delete bibtex)
3 style=GB7714-2015, % can be changed to numerical
4 sorting=nty
5 ]{biblatex}
6 \addbibresource{ref.bib}
```
